EN

FUEL PUMP CONTROL UNIT

Function

The electric fuel pump supplies only the amount of fuel that the high pressure fuel pump requires, and the fuel pump control unit controls the electric fuel pump by means of a pulse width modulated signal.

The pressure in the low pressure fuel system is regulated in normal mode from between 0.5 to 5 bar and the pressure is raised to 6.5 bar for hot and cold starting.

Failure

The fuel pump control unit overheats and fails, the engine does not start due to no fuel pressure.

It is advisable that a reset of the engine ECU learnt adaption values be carried out after fitting a new unit.
